

Exercise 10: Convolutional Neural Networks

Task 1:

- Explain why it is not necessary to manually define which specific filters (e.g. edge detection filters, sharpening filters) are used in the individual convolutional layers when training a CNN.
- Explain why CNN architectures usually consist of *multiple* convolutional layers.
- Why is CNN (in theory) better suited for image processing compared to an MLP?
- If one convolution layer applies seven 3x3x3 filters to the input, what is then the value for d in the size of the filters in the subsequent convolution layer 5x5xd?

Task 2:

- Convolution: Calculate the output feature matrix S of a convolution layer given the following Input I, filter (aka kernel) K, stride s, and padding P.

Example for demonstration:

$$I = \begin{bmatrix} 1 & 2 & 3 & 0 \\ 0 & 1 & 2 & 3 \\ 3 & 0 & 1 & 2 \\ 2 & 3 & 0 & 1 \end{bmatrix}, K = \begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 1 \\ 0 & 1 & 0 \end{bmatrix}, s=3, P=1 \rightarrow S = \begin{bmatrix} 2 & 6 \\ 6 & 2 \end{bmatrix}$$

Your task:

$$I = \begin{bmatrix} 2 & 1 & 0 & 3 & 1 \\ 1 & 2 & 1 & 0 & 2 \\ 3 & 1 & 2 & 1 & 0 \\ 0 & 2 & 1 & 3 & 1 \\ 1 & 0 & 2 & 1 & 2 \end{bmatrix}, K = \begin{bmatrix} 0 & 1 & 0 \\ 1 & -4 & 1 \\ 0 & 1 & 0 \end{bmatrix}, s=2, P=1$$

- Max Pooling: Calculate the output feature matrix S for a max pooling layer given the following Input I, stride s, Kernel size F, and padding P.

Example for demonstration:

$$I = \begin{bmatrix} 1 & 2 & 3 & 0 \\ 0 & 1 & 2 & 3 \\ 3 & 0 & 1 & 2 \\ 2 & 3 & 0 & 1 \end{bmatrix}, s=2, P=0, F=2 \rightarrow S = \begin{bmatrix} 2 & 3 \\ 3 & 2 \end{bmatrix}$$

Your task:

$$I = \begin{bmatrix} 1 & 3 & 2 & 4 \\ 5 & 6 & 1 & 2 \\ 9 & 8 & 3 & 1 \\ 4 & 7 & 2 & 0 \end{bmatrix}, s=2, P=0, F=2$$

Task 3:

Revisit the **MNIST digits** dataset, but this time train a CNN instead of an MLP for the classification. Compare the performance and number of parameters to your models from the previous weeks.
